## I. INTRODUCTION

This project was designed to accommodate the stormwater runoff conditions that occur as a result of development of Block 44, Lot 6 in Elk Township, New Jersey. The development will consist of the construction of a fueling station and convenience store with all associated site improvements. The subject site is located at the intersection of Elk Road and Buck Road in Elk Township, Gloucester County, New Jersey. The subject site is currently orchid farmland.

The scope of this study focuses on the overall drainage conditions resulting from the proposed site improvements. The proposed development will disturb over an acre of land and result in an increase of 5.95 acres of impervious surface.

The primary design constraints for this project are based on requirements established in the Elk Township Design Standards, County Design Standards, New Jersey Soil Erosion and Sediment Control Standards, and N.J.A.C 7:8. More specifically, the stormwater management design will serve to maintain existing drainage patterns to the maximum extent practical and reduce proposed runoff rates when compared to pre-development runoff rates. The proposed project will disturb over 1 acre and proposed impervious coverage will be increased by more than ¼ acre; therefore, the project meets the definition of a “major development” under N.J.A.C. 7:8.

## II. EXISTING SITE CONDITIONS

The subject site consists of approximately 65.81 acres. The site is mainly orchid farmland with its associated features, and woods. The proposed improvements will be limited to an area of 15.13 acres, which is the area of study this report will focus on.

Based on the Web Soil Survey, the soil types native to the site include:

| SOIL TYPE | SOIL TYPE NAME                                                   | HYDRAULIC SOIL GROUP |
|-----------|------------------------------------------------------------------|----------------------|
| AugB      | Aura sandy loam, 2 to 5 percent slopes, Northern Tidewater Area  | B                    |
| AvtB      | Aura-Sassafras sandy loams, 2 to 5 percent slopes                | B                    |
| DeoA      | Downer sandy loam, 0 to 2 percent slopes, Northern Coastal Plain | A                    |
| HbmB      | Hammonton loamy sand, 0 to 5 percent slopes                      | B                    |
| WokA      | Woodstown-Glassboro complex, 0 to 2 percent slopes               | B                    |

The site has been evaluated using the TR-55 'Urban Hydrology for Small Watersheds' standards. Below is a description of the drainage sub-watershed area as depicted on the Existing Drainage Area Map:

Existing Drainage Area to Point of Interest 1: This study point represents the location where all runoff from the drainage area exits the site into the adjoining property. It represents the point where the peak flow generated will occur in the existing condition. The land cover is mainly orchard farmland and woods. This study point has been analyzed to show compliance with the applicable NJDEP, Gloucester County and Elk Township regulations.

Existing Drainage Area to Point of Interest 2: This study point represents the location the isolated wetland where all runoff from the drainage area is captured. It represents the point where the runoff volume generated will flow in the existing condition. The land cover is mainly orchard farmland and woods. This study point has been analyzed to show compliance with the applicable NJDEP, Gloucester County and Elk Township regulations.

Existing Drainage Area to Point of Interest 3: This study point represents the location of the isolated pond where all runoff from the drainage area is captured. It represents the point where the runoff volume generated will flow in the existing condition. The land cover is mainly wooded with the pond water surface. Land cover of the pond water surface is considered impervious. This study point has been analyzed to show compliance with the applicable NJDEP, Gloucester County and Elk Township regulations.

### **III. PROPOSED SITE CONDITIONS**

The proposed site improvements will result in an overall increase in impervious coverage of 10.07 acres. The proposed design serves to match the existing drainage patterns to the maximum extent practical. The site has been evaluated using the TR-55 'Urban Hydrology for Small Watersheds' standards and with the following proposed drainage sub-watershed areas as depicted on the Proposed Drainage Area Map.

Proposed Drainage Area to Point of Interest 1: This study point represents the location where all runoff from the drainage area exits the site into the adjoining property. It represents the point where the runoff volume generated by the development will flow in the proposed condition. The land cover is impervious parking, lawn, woods, and orchard farmland. This study point has been analyzed to show compliance with the applicable NJDEP, Gloucester County and Elk Township regulations.

Proposed Drainage Area to Point of Interest 2: This study point represents the location the isolated wetland where all runoff from the drainage area is captured. It represents the point where the runoff volume generated by the development will flow in the proposed condition. The land cover is mainly impervious structures and their associated improvements. This study point has been analyzed to show compliance with the applicable NJDEP, Gloucester County and Elk Township regulations.

Proposed Drainage Area to Point of Interest 3: This study point represents the location of the isolated pond where all runoff from the drainage area is captured. It represents the point where the runoff volume generated by the development will flow in the proposed condition. The land cover is lawn, woods, and the pond water surface. Land cover of the pond water surface is considered impervious. This study point has been analyzed to show compliance with the applicable NJDEP, Gloucester County and Elk Township regulations.

#### **IV. DESIGN METHODOLOGY**

The design intention of the proposed stormwater management facilities for this project is to provide measures as required to address applicable aspects of the Elk Township Design Standards, Gloucester County Design Standards, New Jersey Soil Erosion and Sediment Control Standards, and N.J.A.C 7:8.

Based upon our review of the existing site conditions and the Boundary & Topographic Survey prepared by Van Cleef Engineering Associate, the Drainage Area Maps for the existing and proposed site conditions as defined within this report were established. A Grading Plan was

developed for the proposed site improvements with consideration to the existing drainage patterns to the maximum extent practicable. The project was designed to ensure runoff from the proposed development would meet the required peak flow rate reductions of 50%, 75% and 80% for the current and projected 2-year, 10-year, and 100-year storm events respectively.

Stormwater runoff generated by the proposed improvements will be collected by grading site features, berms and swales to direct runoff to the proposed bioretention basins that discharge to the Study Points discussed above. The storm sewer design accommodates the 100-yr design storm utilizing the Rational Method under free-flowing conditions. Associated calculations are included in the Appendix of this report.

Based upon the scope of the project, the development is classified as a major development; and therefore, the project has been designed to meet the stormwater runoff quantity set forth by the Elk Township Design Standards, Gloucester County Design Standards, and NJAC 7:8. The following items are addressed within this report:

- Erosion control and runoff quantity standards
- Stormwater runoff quality standards
- Calculation of stormwater runoff
- Standards for structural stormwater management measures
- Green Infrastructure Techniques

Runoff volumes for the site were modeled utilizing HydroCAD computer software using the Urban Hydrology for Small Watershed TR55 method for the applicable design storms. The 2-, 10- and 100-year quantity design storms are based upon the current and projected New Jersey 24-Hour Rainfall Frequency Data for Gloucester County utilizing a NOAA region C rainfall distribution. Pervious and impervious areas were modeled separately as suggested in the NJDEP Stormwater Management Best Management Practices Manual.

## V. STORMWATER MANAGEMENT

### Point of Interest 1:

Stormwater Quality and Groundwater recharge standards were met with the use of ten (10) small-scale bioretention basins with 80% TSS removal. The NJDEP BMP manual lists small-scale bioretention basins as an acceptable Green Infrastructure BMP for water quality, quantity, and recharge purposes. Stormwater Quantity standards were met with the use of two (2) large-scale infiltration basins. The NJDEP BMP manual lists small-scale infiltration basins as an acceptable Green Infrastructure BMP for water quantity purposes.

The required peak reduction rates for POI-1 were calculated using 100% of the undisturbed area added to the required reductions for the improved areas (50%, 75% and 80% of the 2yr, 10yr and 100 yr storms, respectively). The following is a comparison of overall pre- and post-development runoff rates for the proposed project disturbance area as required by N.J.A.C. 7:8:

#### Point of Interest 2:

Stormwater Quality and Groundwater recharge standards were met with the use of three (3) small-scale bioretention basins with 80% TSS removal. The NJDEP BMP manual lists small-scale bioretention basins as an acceptable Green Infrastructure BMP for water quality, quantity, and recharge purposes. All runoff flows to an isolated wetland with zero discharge; therefore, stormwater quantity standards were met by ensuring the proposed runoff volume did not exceed the available volume in the wetland.

#### Point of Interest 3:

No new regulated impervious surfaces are proposed within this drainage area therefore stormwater Quality and Groundwater recharge standards are not required. All runoff flows to a pond with zero discharge; therefore, stormwater quantity standards were met by ensuring the proposed runoff volume did not exceed the available volume in the pond.

## **VII. CONCLUSION**

The proposed project has been designed in a manner that will not adversely impact the existing drainage patterns, adjacent roadways or adjacent parcels. The stormwater runoff rates for the 2, 10, and 100-year design storms have been designed to meet the required reductions rates. The stormwater runoff rates for the project disturbance area for the 2, 10, and 100-year design storms meet or exceed the reduction criteria set forth by N.J.A.C. 7:8 under free flow conditions. With that stated, it is evident that the proposed development meets all regulatory

requirements and will not have a negative impact on any existing stormwater management systems within the vicinity of the subject parcel.

## MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

## Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

1/ Average runoff condition, and  $I_a = 0.2S$ .

2/ The average percent impervious area shown was used to develop the composite CNs. Other assumptions are as follows: impervious areas are directly connected to the drainage system, impervious areas have a CN of 98, and pervious areas are considered equivalent to open space in good hydrologic condition.

3/ CNs shown are equivalent to those of pasture. Composite CNs may be computed for other combinations of open space type.

4/ Composite CNs for natural desert landscaping should be computed using figures 9-3 or 9-4 based on the impervious area percentage (CN=98) and the pervious area CN. The pervious area CNs are assumed equivalent to desert shrub in poor hydrologic condition.

**(2) Use of table 9-1**

Chapters 7 and 8 of NEH 630 describe how soils and covers of watersheds or other land areas are classified in the field. After the classification is completed, CNs are read from table 9-1 and applied as described

in chapter 10. Because the principal use of CNs is for estimating runoff from rainfall, the examples of applications are given in chapter 10.

1/ Average runoff condition, and  $I_a = 0.2s$ .

2/ Crop residue cover applies only if residue is on at least 5 percent of the surface throughout the year.

3/ Hydrologic condition is based on combinations of factors that affect infiltration and runoff, including (a) density and canopy of vegetative areas, (b) amount of year-round cover, (c) amount of grass or close-seeded legumes, (d) percent of residue cover on the land surface (good  $\geq 20\%$ ), and (e) degree of surface toughness.

Poor: Factors impair infiltration and tend to increase runoff.

Good: Factors encourage average and better than average infiltration and tend to decrease runoff.

For conservation tillage poor hydrologic condition, 5 to 20 percent of the surface is covered with residue (less than 750 pounds per acre for row crops or 300 pounds per acre for small grain).

For conservation tillage good hydrologic condition, more than 20 percent of the surface is covered with residue (greater than 750 pounds per acre for row crops or 300 pounds per acre for small grain).

4/ Poor: < 50% ground cover or heavily grazed with no mulch.

Fair: 50 to 75% ground cover and not heavily grazed.

Good: > 75% ground cover and lightly or only occasionally grazed.

5/ Poor: < 50% ground cover.

Fair: 50 to 75% ground cover.

Good: > 75% ground cover.

6/ If actual curve number is less than 30, use CN = 30 for runoff computation.

7/ CNs shown were computed for areas with 50 percent woods and 50 percent grass (pasture) cover. Other combinations of conditions may be computed from the CNs for woods and pasture.

8/ Poor: Forest litter, small trees, and brush are destroyed by heavy grazing or regular burning.

Fair: Woods are grazed, but not burned, and some forest litter covers the soil.

Good: Woods are protected from grazing, and litter and brush adequately cover the soil.

Inflow Area = 76,395 sf, 11.43% Impervious, Inflow Depth = 0.44" for 2-Year-2050 event  
Inflow = 0.92 cfs @ 12.09 hrs, Volume= 2,824 cf  
Outflow = 0.00 cfs @ 0.00 hrs, Volume= 0 cf, Atten= 100%, Lag= 0.0 min

Routing by Dyn-Stor-Ind method, Time Span= 0.00-36.00 hrs, dt= 0.01 hrs  
Peak Elev= 119.28' @ 25.23 hrs Surf.Area= 10,136 sf Storage= 2,824 cf

Plug-Flow detention time= (not calculated: initial storage exceeds outflow)  
Center-of-Mass det. time= (not calculated: no outflow)

Inflow = 1.46 cfs @ 12.09 hrs, Volume= 6,886 cf  
Outflow = 0.00 cfs @ 0.00 hrs, Volume= 0 cf, Atten= 100%, Lag= 0.0 min

Routing by Dyn-Stor-Ind method, Time Span= 0.00-36.00 hrs, dt= 0.01 hrs  
Peak Elev= 119.67' @ 25.23 hrs Surf.Area= 10,611 sf Storage= 6,886 cf

Plug-Flow detention time= (not calculated: initial storage exceeds outflow)  
Center-of-Mass det. time= (not calculated: no outflow)
